Designing for Usability: Key Principles and What Designers Think

JOHN D. GOULD and CLAYTON LEWIS

ABSTRACT: *This article is both theoretical and empirical. Theoretically, it describes three principles of system design which we believe must be followed to produce a useful and easy to use computer system. These principles are: early and continual focus on users; empirical measurement of usage; and iterative design whereby the system (simulated, prototype, and real) is modified, tested, modified again, tested again, and the cycle is repeated again and again. This approach is contrasted to other principled design approaches, for example, get it right the first time, reliance on design guidelines. Empirically, the article presents data which show that our design principles are not always intuitive to designers; identifies the arguments which designers often offer for not using these principles—and answers them; and provides an example in which our principles have been used successfully.*

Any system designed for people to use should be easy to learn (and remember), useful, that is, contain functions people really need in their work, and be easy and pleasant to use. This article is written for people who have the responsibility and/or interest in creating computer systems (or any other systems) with these characteristics. In the first section of this article we briefly mention three principles for system design which we believe can be used to attain these goals. Our principles may seem intuitive, but system designers do not generally recommend them, as results of surveys reported in Section 2 show. The recommendations of actual designers suggest that they may sometimes think they are doing what we recommend when in fact they are not. In Section 3 we contrast some of their responses with what we have in mind to provide a fuller and clearer description of our principles. In Section 4 we consider why designers might not actually be using our design

principles. In Section 5 we elaborate on the three principles, showing how they form the basis for a general methodology of design. In Section 6 we describe a successful example of using our recommended methodology in actual system design, IBM's Audio Distribution System (ADS), and the advantages that accrued as a result.

1. THE PRINCIPLES

We recommend three principles of design.

Early Focus on Users and Tasks

First, designers must understand who the users will be. This understanding is arrived at in part by directly studying their cognitive, behavioral, anthropometric, and attitudinal characteristics, and in part by studying the nature of the work expected to be accomplished.

Empirical Measurement

Second, early in the development process, intended users should actually use simulations and prototypes to carry out real work, and their performance and reactions should be observed, recorded, and analyzed.

Iterative Design

Third, when problems are found in user testing, as they will be, they must be fixed. This means design must be iterative: There must be a cycle of design, test and measure, and redesign, repeated as often as necessary.

2. WHAT SYSTEM DESIGNERS AND PROGRAMMERS ACTUALLY SAY

We began recommending these principles in the 1970's. Often the reaction is that they are obvious. Nevertheless, they are not usually employed in system design.

update to your org. Perform an initial deployment to a local IT-Test group to pilot test the new software app before sending it to the entire organization.

Task 5

View the news about the latest headset from Plantronics. After viewing it, remove the message and make it so Plantronics Manager no longer sends you information on new products.

Task 6

You decide that you are going to purchase a entire boatload of the EncorePro 700 headsets for deployment in your organization, and you would like to configure their settings in advance of distributing them to all employees. How would you proceed?

Task 7

Your team has received some feedback from the SALES team about some of the default settings for the Blackwire C720 device. Create the following custom configuration to address their needs and deploy these new settings to the SALES team. Be sure to describe the change to them so they know what to expect.

- Disable the Auto-Answer setting and make it so end-users cannot change this setting.
- Disable the 'Mute Off' Reminder setting.

Task 8

Now that you have deployed your new settings for Blackwire C720 v.12 firmware. How would you deploy the same settings with one additional setting configuration to the Marketing group?

update to your org. Perform an initial deployment to a local IT-Test group to pilot test the new software app before sending it to the entire organization.

Task 5

View the news about the latest headset from Plantronics. After viewing it, remove the message and make it so Plantronics Manager no longer sends you information on new products.

Task 6

You decide that you are going to purchase a entire boatload of the EncorePro 700 headsets for deployment in your organization, and you would like to configure their settings in advance of distributing them to all employees. How would you proceed?

Task 7

Your team has received some feedback from the SALES team about some of the default settings for the Blackwire C720 device. Create the following custom configuration to address their needs and deploy these new settings to the SALES team. Be sure to describe the change to them so they know what to expect.

- Disable the Auto-Answer setting and make it so end-users cannot change this setting.
- Disable the 'Mute Off' Reminder setting.

Task 8

Now that you have deployed your new settings for Blackwire C720 v.12 firmware. How would you deploy the same settings with one additional setting configuration to the Marketing group?

Lifesaver, great app! I was literally 2 feet away from my headset and could not find it. I sent a tone and **found it in 34 seconds**. It was laying under a magazine in my bathroom. Great app!

Robert Linz on Feb 13, 2014 at 5:36 PM

I used BackTrack to go to the last place I used my headset, then I sent a tone to find it in that room. I love Plantronics!

Real Researchers on Jun 20, 2014 at 4:57 PM

Lifesaver! Love it! Simple! Loud. Works! Makes the headset beep loud and tracks back its general location. Wonderful.
I would have paid for this app.
